                                                                      Novel secreted factor encoded by clone P00210D09 useful for diagnosing, treating and/or preventing various cardiac, renal and inflammatory
                                                                                                                                 The present sequence is a novel secreted factor encoded by rat cDNA clone P00210D09. The invention relates to a polypeptide comprising a sequence of at least 80% identity to residues 22-122 of the present sequence, or a sequence encoded by a nucleic acid hybridising under stringent conditions to the complement of the coding region comprising 1031 nucleotides, and having at least one biological activity of the polypeptide encoded by clone P00210D09. The polypeptides and polynucleotides of the invention are useful for the treatment of cardiac, renal and inflammatory diseases. The polynucleotides are useful in antisense mediated gene inhibition and in gene therapy. The polypeptides are useful in assays for identifying lead compounds that may be used as therapeutic agents in the treatment of cardiac,
                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                          1 QVIDGASRILERSLSSRSRVIANYALVPFHDPDIGPVTLTADPVVFQRELRQLYVQGGGD 60

The present sequence is obtained from a clustral X alignment with protein 608. Protein 608 was identified using the method of the invention after subjecting rat osteoblasts to mechanical stress. Expression of the 608 gene was found to be uprequiated by about 3-fold in cells subjected to mechanical strain. The specification describes a method for the cells of genes responsive to a specific mechanical stress. The method comprises applying the mechanical stress to an organism (tissue correctls comprising bone cells), isolating the specific cellular correctls comprising bone cells), isolating the specific cellular cannow in comparison with control samples. The method is used to identify genes whose expression is responsive to a specific stress. The identified comprises state. The risk determination methods are used for teasting a medicament for gene therapy. These medicaments, or genes identified by the method of the invention, are used for treating, preventing or controlling a physiological or disease state (especially osteoporosis or bone density or other factors causing or contributing to osteoporosis or its symptoms or other conditions involved in mechanical stress or its lack. The methods can also be used for advancing research or studies in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1 QVIDGASRILERSLSSRSRVIANYALVPFHDPDIGPVTLTADPVVFQRELRQLYVQGGGD 60

The present sequence is that of human interleukin-B60 (IL-B60), a novel, small soluble cytokine-like protein that exhibits structural motifs characteristic of a member of the long-chain cytokines, and motifs characteristic of a member of the long-chain cytokines, and which shows homology to granulocyte colony stimulating factor and interleukin-6. IL-60B may have either stimulatory or inhibitory ceffects on haematopotetic cells, including e.g. lymphoid cells, such as T-cells, B-cells, natural killer cells, macrophages, character cells, haematopotetic progenitors, etc. Methods are provided for modulating the physiology or development of a cell or tissue culture cells by contexting the cell with an agonist or antagonist of IL-B60 or an agonist of antagonist of a complex of mature IL-B60 and its partner, cytokine-like factor-1 (CLF-1, see CABB19588). The IL-B60/CLF-1 cytokine serves as a key physiological factor in motor neuron development and regeneration. IL-60B, its autolmmune disorders and also for drug screening.
                polypeptides, and nucleic acids, useful in research, diagnosis and for treating inflammatory and autoimmune disorders -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cytokine-like factor 1 (CLF-1) and interleukin (IL)-B60 complexes, polypeptides, and nucleic acids, useful in research, diagnosis and for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Interleukin-B60; IL-B60; mouse; cytokine; cytokine-like factor-l;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ë,
                                                                                   the encoded polypeptides (AMM421313) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, and thrombolytic activity, chemotactic/chemokinetic activity, haemostatic assays for receptor activity, arthritis and inflammation, leukaemias and CNNS disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Note: The sequence data for this patent did not form part of the printed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to human nucleic acids (AAIS7798-AAI61369) and

                                             The present sequence is that of mouse interleukin-B60 (IL-B60), a novel, small soluble cytokine-like protein that exhibits structural motifs characteristic of a member of the long-chain cytokines, and which shows homology to granulocyte colony stimulating factor and interleukin-6. IL-60B may have either stimulatory or inhibitory caffects on haematopoietic cells, including e.g. lymphoid cells, such as T-cells, B-cells, natural killer cells, macrophages, dendritic cells, haematopoietic progenitors, etc. Methods are provided for modulating the physiology or development of a cell or tissue culture cells by contacting the cell with an agonist of antagonist of IL-B60 or an agonist of antagonist of a complex of mature IL-B60 and its partner, cytokine-like factor-1 (CLF-1, see CRAB19588). The IL-B60/CLF-1 cytokine serves as a key physiological factor in motor neuron development and regeneration. IL-60B, its autoimmune disorders and also for drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; biologically active complex; haemopoietin receptor; NR6;

The present invention relates to a biologically active complex comprising a haemoplotein receptor, NKG and cardiotrophin-like cytokine (CLC). The complex is useful in the manufacture of a medicament for the treatment and/or prophylaxis of a subject, as it is involved in facilitating proliferation, differentiation and/or survival of a cell. The complex or its components have neurotrophic activity. The present sequence is human cardiotrophin-like cytokine (CLC) protein.
                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Newly isolated nucleic acid encoding human or murine neurotrophic factor NNT-1 - useful for treatment of neurological and immunological diseases or inflammation, also as vaccine adjuvant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 NNT-1; neurotrophic factor; human; antiinflammatory; adjuvant; Alzheimer's disease; Parkinson's disease; Huntington's disease; amyotrophic lateral sclerosis; Charcot-Marie-Tooth syndrome; peripheral neurophathy; dystrophy; neural retina degeneration; common variable immunodeficiency; CVID; selective IgA deficiency; hypogammaglobulinaemia; X-linked agammaglobulinaemia; antiseptic;

This is the amino acid sequence of a novel neurotrophic factor, designated NNT-1, that is a growth factor for neurons and for B or T cells. It was deduced from isolated CDNA (see AAV4751) and genomic DNA (see AAV4751) clones. Vectors containing the cDNA or genomic DNA and host cells are provided for use in the production of NNT-1 polypeptides. These are used to treat: (i) neurological or immunological diseases, specifically Alzheimer's, Parkinson's or Huntington's diseases, smyotrophic lateral sclerosis, Charcot-Marie-Tooth syndrome, peripheral neuropathy, dystrophy and degeneration of the neural retina, or conditions characterised by T or B cell defects, eg. common variable immunodeficiency (CVID), selective IgA deficiency, hypogammaglobulinaemia and X-linked and malamation. NNT-1 is also able to boost immunoreactivity and antibody production following vaccination, and, since it inhibits treating sepsis. In addition, cells that have been engineered to express NNT-1 can be implanted, or nucleic acids are delivered in gene therapy vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

This is the amino acid sequence of a murine neurotrophic factor, designated NNT-1, that is a growth factor for neurons and for B or T cells. It was deduced from isolated NNT-1 (See AAV47512).

Human NNT-1 (see AAV47915) is also provided. Vectors and host cells for use in the production of human murine recombinant NNT-1 (See AAV47915).

Con use in the production of human murine recombinant NNT-1 (See AAV47915) is also provided. Vectors and host cells for use in the production of human murine recombinant NNT-1 (Innunclogical diseases, specifically Alzheimer's, Parkinson's or Huntington's diseases, amyotrophic lateral sclerosis, charcotro-warie-rooth syndrome, peripheral neuropathy, destrophy and degeneration of the neural retina, or conditions characterised by T or B cell defects, e.g. common variable immunodeficiancy (CVID), caselective IgA deficiency, hypogammaglobulinaemia and X-linked agammaglobulinaemia (claimed) but many others disclosed; and (11) inflammation. NNT-1 is also able to boost immunoractivity and antibody production following vaccination, and, since it inhibits treating sepsis. In addition, cells that have been engineered to express NNT-1 can be implanted, or nucleic acids are delivered in

neurons. The NNT-1 protein is useful in the treatment of neurological diseases characterised by the degeneration and death of particular classes of neurons. These diseases specifically include Parkinson's disease, amyotropic lateral sclerosis (ALS), Alzheimers's disease, stroke and various degenerative disorders affecting vision.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a novel cardiotrophin-like cytokine

                                                                                                                                                     The present sequence represents a human neurotrophic factor, designated NNT-1, which is capable of stimulating growth of motor or sympathetic neurons. The NNT-1 protein is useful in the treatment of neurological diseases characterised by the degeneration and death of particular classes of neurons. These diseases specifically include Parkinson's disease, amyotropic lateral sclerosis (ALS), Alzheimers's disease, stroke and various degenerative disorders affecting vision.

(I) is useful for producing NNT-1 polypeptides which are useful for treating patients in whom various cells of the central, autonomic, or peripheral nervous system have degenerated and/or have been damaged by congenital disease, trauma, mechanical damage, surgery, stroke, ischemia, infection, metabolic disease, nutritional deficiency, malignancy and/or toxic agents. NNT-1 proteins are used to treat diseases like Alzhaimer's, Parkinson's, amyotrophic lateral sclerosis, Charcot-Marie-Tooth syndrome, Huntington's disease, peripheral neuropathy induced by diabetes or other metabolic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 treatment;

as retinitis pigmentosa, drug-induced retinopathies, stationary forms of hematopoietic disorders. (I) is effective in treating neurological conditions and promotes neuron regeneration. Immune disorders and conditions and promotes neuron regeneration. Neural functions are effectively restored in patients suffering from various neurological disorders. This sequence represents the human NNT-1 protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes a novel nucleic acid molecule (I) encoding a novel neurotrophic factor (NNT-1) (II) which has nootropic, neuroprotective, anticonvolusant, antiparkinsonian, antidabetic and ophthalmological activity. (I) is useful for producing NNT-1 polypeptides which are useful for treating patients in whom various cells of the central, autonomic, or peripheral nervous system have degenerated and/or have been damaged by congenital disease, trauma, mechanical damage, surgery, stroke, ischemia, infection, metabolic disease, nutitional deficiency, malignancy and/or toxic agents. NNT-1 proteins are used to treat diseases like Alzheimer's, parkinson's, amyotrophic lateral sclerosis, Charcot-Marie-Tooth syndrome, Huntington's disease, peripheral neuropathy induced by diabetes or other metabolic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           NNT-1; neurotrophic factor; nootropic; neuroprotective; treatment; anticonvulsant; antiparkinsonian; antidiabetic; ophthalmological; nervous system degeneration; Alzheimer's disease; Parkinson's disease; amyotrophic lateral sclerosis; Charcot-Marie-Tooth syndrome; murine; Huntington's disease; peripheral neuropathy; neural retina degeneration; retinopathy; immune disorder; hematopoietic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acids encoding neurotrophic factors useful for stimulating growth of motor or sympathetic neurons for treating neuron cell damage

disorders, and/or dystrophies or degeneration of the neural retina such as retinits pigmentosa, drug-induced retinopathies, stationary forms of night blindness, progressive cone-rod degeneration, immune disorders and hematopoietic disorders. (I) is effective in treating neurological conditions and promotes neuron regeneration. Neural functions are effectively restored in patients suffering from various neurological disorders. This sequence represents the murine NNT-1 protein described in the method of the invention.

N.Alternate names: protein T17J13.110
C.Species: Arabidopsis thaliana (mouse-ear cress)
C.Species: Arabidopsis thaliana (mouse-ear cress)
C.Sacession: T48007
C.Accession: T48007
C.Accession: T48007
A.Reference number: 224482
A.Accession: T4807
A.Coostreferences: EMBL:Al.138651
submitted to the EMBL Data Library, June 1998
A;Description: Hemicentin is required for hemidesmosome mediated cell adhesion and germ-
A;Reference number: 222396
A;Accession: T43290
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A Map position: 3

-I- FUNCTION: BINDS TO FOUR LIGANDS: SPITZ, GURKEN, VEIN AND ARGOS, WHICH IS AN ANTAGONIST. TRANSDUCES THE SIGANL THROUGH THE RAS-RAF-MAPK PATHWAY. INVOLVED IN A WYRIAD OF DEVELOPMENTAL DECISIONS.

CRITICAL FOR THE PROLIFERATION OF IMAGINAL TISSUES, AND FOR THE DETERMINATION OF BOTH THE ANTERO-POSTERIOR AND DORSO-VENTRAL POLARITIES OF THE COCYTE. IN THE EMBRROV, DIAKS A ROLE IN THE ESTABLISHMENT OF VENTRAL CELL FATES, MAINTENANCE OF AMNIOSEROSA AND VENTRAL NEUROECTODERMAL CELL FATES, GERM BAND RETRACTION, CELL FATE SPECIFICATION IN THE CENTRAL NERVOUS SYSTEM AND PRODUCTION OF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ATTERNATIVE PRODUCTS: 3 ISOFORMS; TYPE I (SHOWN HERE), TYPE II AND TYPE III; ARE PRODUCED BY ALTERNATIVE SPLICING.
TISSUE SPECIFICITY: UBIOUTOUSLY EXPRESSED IN EMBRYOS. IN LARVAE,
UNIFORM EXPRESSION IS SEEN IN WING DISKS, GENITAL DISK, ANLAGEN OF
TESTIS AND OVARY, AND BRAIN CORTEX. IN EYE-ANTENNA DISK, HIGHEST
EXPRESSION IS ANTERIOR TO MORPHOGENETIC FURROW, LEVELS REMAIN HIGH
IN PHOTORECEPTOR PRECURSOR CELLS. THIS PATTERN IS REVERSED IN
POSTERIOR EYE DISK. IN ADULTS EXPRESSION IS HIGH IN BRAIN CORTEX
AND THORACIC AND ABDOMINAL GANGLIA.
SIMILARITY: BELONGS TO THE EGF RECEPTOR FAMILY.

Mol. Plant Microbe Interact. 6;735-744(1993).

-I FUNCTION: GLYCOSYLTRANSFERASE REQUIRED FOR THE SYNTHESIS OF SUCCINOGLYCAN (EPS I). NEEDED FOR THE ADDITION OF THE SIXTH SUGAR (GLUCOSE). CATALYZES THE FORMATION OF A BETA-1,6 LINKAGE BETWEEN THE FIFTH AND SIXTH SUGAR.

-I PATHWAY: EXOPOLYSACCHARIDE BIOSYNTHESIS.

-I SUBCELLULAR LOCATION: CYTOPLASMIC.

-I SUBCELLULAR LOCATION: CYTOPLASMIC.

                                                                                                                                                       The present sequence encodes a novel secreted factor. The invention relates to a polypeptide comprising a sequence of at least 80% identity to residues 22-132 of a 275 anino acid sequence, or a sequence encoded by a nucleic acid hybridising under stringent conditions to the complement of the coding region comprising 1031 nucleotides, and having at least one biological activity of the polypeptide encoded by clone p00210009. The polypeptides and polynucleotides of the invention are useful for the treatment of cardiac, renal and inflammatory diseases. The polynucleotides are useful in antisense mediated gene inhibition and in gene therapy. The polypeptides are useful in assays for identifying lead compounds that may be used as therapeutic agents in the treatment of cardiac, kidney or inflammatory diseases.
                                                                               Novel secreted factor encoded by clone P00210D09 useful for diagnosing, treating and/or preventing various cardiac, renal and inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              120
